

Red Fluorescent SiO₂ Magnetic Particles-NH₂

PRODUCT DATA SHEET

Red Fluorescent SiO₂ Magnetic Particles-NH₂

Description

Fluorescent Particles are prepared by either incorporation of selected fluorophores into monodisperse polystyrene particles by means of swelling processes or by copolymerization of styrene with various organic fluorescent dyes, these processes generate fluorophores labeled polystyrene particles with favorable properties. As a result, a wide variety of fluorescent particles can be prepared ranging in size, type of fluorophore, fluorescence intensity and surface functional groups. Most of the fluorophores chosen for use in the preparation of Fluorescent Particles are water insoluble and therefore are very stable. These fluorophores, once incorporated into the particles, do not leach and their color and fluorescence remains stable for long periods of time under proper storage conditions. Fluorescent particles with single or multiple fluorophores are available in various sizes, emission spectra and combinations. Many are suitable for uses in flow cytometry, fluorescence microscopy, phagocytosis studies and cell labeling.

For custom sizes, formulations or bulk quantities please contact our customer service department.

Characteristics

Concentration: 10 mg/ml

Size: 10 ml; 20 ml

Surface: NH₂

Shape: Spherical

Composition: Magnetic SiO₂ Particles

Standard deviation: CV<5%

Excitation: 620 nm

Emission: 680 nm

Buffer: PBS

Form: Suspension

1378 US-206 Ste 6-126, Skillman, NJ USA

info@abvigenus.com

Tel: 1-816-388- 0112 Fax: 1- 888-616-0161
