

Amine Silver Nanoparticles-PEG3K

PRODUCT DATA SHEET

Amine Silver Nanoparticles-PEG3K

Description

Cytodiagnostics amine spherical silver nanoparticles are available in 9 different sizes ranging from 5 nm ~ 100 nm and are also available with 2 different spacer lengths (3 kDa and 5 kDa), allowing for better optimization.

Our unique silver nanoparticles synthesis and purification protocols consistently produce high quality monodisperse silver nanoparticles with a narrow size distribution (CV < 18%) and high purity.

Cytodiagnostics nano silver products are ideal for a wide range of applications including photovoltaics, biological sensor development and nanotoxicology studies.

For custom sizes, formulations or bulk quantities please contact our customer service department.

Characteristics

Core diameter: 5 ~ 100 nm

Size dispersity: Coefficient of Variance (CV) < 18%

Surface functional group: PEG3K-NH₂

Concentration: 1 mg/ml

Polydispersity Index (PDI): < 0.25

Absorbance (λ_{max}): 390 ~ 490 nm

Supplied in ddH₂O

Advantages

Monodisperse

Well defined sizes from 5 nm to 100 nm

Precisely engineered & functionalized surfaces

Extensive range of surface functionalities designed for in vitro and in vivo applications

Application

Ideal for development of silver conjugates for use in for example:

Immunoblotting

Lateral Flow Assays

LSPR Assays

Microscopy Applications (e.g. TEM, Darkfield)

Storage

This product should be stored away from light at 4°C. **DO NOT FREEZE.** If stored as specified, the product is stable for at least 4 months.

Handling

When stored for a long period of time silver nanoparticles may sediment at the bottom of the vial, which is especially true for larger particle sizes. Prior to use, re-suspend the sedimented particles by swirling until a homogenous solution is obtained.

Note

These products are for R&D use only, not for drug, household, or other uses.
